Cascading operations may not be nested more than 15 levels deep • Like MySQL in general, in an SQL statement that inserts, deletes, or updates many rows, InnoDB checks UNIQUE and FOREIGN KEY constraints row-by-row.. Este tipo borra al 'padre' y borra a todos los • InnoDB permits a foreign key to reference any index column or group of columns.. And statements using this clause are not allowed for InnoDB tables • If there are several rows in the parent table that have the same referenced key value, InnoDB acts in foreign key checks as if the other parent rows with the same key value do not exist.. • does not currently support foreign keys for tables with user-defined partitioning.
